tanks for internal inspection, the lining inspection procedure recommended by Nisshin Gulf Coast, Inc. or Nisshin Corporation (lining installers) on file with the OHMSAPD must be followed. The procedure is summarized as follows:

(i) Collect analysis data for Fe contamination of the last five loadings of the cargo tank as measured by ICP-MS or GFAA.

(ii) Compare these values to the Fe contamination levels of the chemical before it was introduced to the cargo tank.

(iii) If the after-filling contamination levels are 50 ppb or greater than the corresponding values before filling, a defect in the tank lining is indicated. If the exterior valves, piping, etc. used to load the tank are free from defects, and any other possible sources of contamination have been eliminated, the tank lining must be inspected visually and by spark testing.

c. OPERATIONAL CONTROLS - The special permit holder must maintain records of product contamination for each shipment, as described above. The analysis of product contamination must be completed before the cargo tank is refilled and, in any case, within 15 days after the lading is unloaded. Records of contamination analysis must be retained for at least the five most recent shipments.
